

Great Lakes Ensemble

This project will be split into two main parts (short-term and long-term), because we want to get usable information to stakeholders as quickly as possible (short-term) while working toward a more "complete" evaluation and assessment (long-term). The short-term project builds on our existing knowledge of ensemble needs for the region and focuses on two datasets that we will use as a prototype (CMIP5 GCMs and dynamically downscaled NARRCAP simulations). The long-term portion of this project will be working towards a more comprehensive review and analysis of additional literature and datasets that will be considered for inclusion in the GL Ensemble.
